

Private deployments

- npm can install a package from Github commit/branch/tag
- “dependencies”: { “react”: “facebook/react#v16.13.1” }
- Caveat: the package will now be built inside the host project
- Add ‘npm run prepare’ under the scripts object of package.json with the target to build the package
- This adds up to the build time

```
{
  "name": "myAwesomeLibrary",
  "version": "0.0.1",
  "files": [
    "dist/*"
  ],
  "main": "dist/index.js",
  "scripts": {
    "build": "webpack",
    "prepare": "npm run build",
  },
  "dependencies": { },
  "devDependencies": { },
  "peerDependencies": {
    "react": "^16.13.1"
  },
  "private": true
}
```
